

A farmer wants a program to perform basic calculations related to farming.

The program should:

- Display the farmer's profile.
- Add the weights of two harvested crops.
- Find the square root of the total harvested area.
- Calculate the area of a triangular field.
- Swap the quantities of two fertilizer bags if entered in the wrong order.

```
File Edit Format Run Options Window Help
print("-----Profile-----")

print("Farmer Name : Nitesh yadav")
print("Village : Ramnagar")
print("Farm : 20 Acres")

c1 = int(input("Enter the weight of first crop : "))
c2 = int(input("Enter the weight of second crop : "))
total = c1 + c2
print("Total Weight =", total, "kg")

import math
area = int(input("Enter the total harvested area : "))
print("Square Root =", math.sqrt(area))

base = int(input("Enter the base : "))
height = int(input("Enter the height : "))
area = 0.5 * base * height
print("Area of Triangle =", area)

bag1 = int(input("Enter the quantity of first fertilizer bag : "))
bag2 = int(input("Enter the quantity of second fertilizer bag : "))
temp = bag1
bag1 = bag2
bag2 = temp

print("Swaping of Fertilizer Bags =", bag1, bag2)
```

```
-----Profile-----
Farmer Name : Nitesh yadav
Village : Ramnagar
Farm : 20 Acres
Enter the weight of first crop : 10
Enter the weight of second crop : 30
Total Weight = 40 kg
Enter the total harvested area : 200
Square Root = 14.142135623730951
Enter the base : 56
Enter the height : 100
Area of Triangle = 2800.0
Enter the quantity of first fertilizer bag : 30
Enter the quantity of second fertilizer bag : 40
Swaping of Fertilizer Bags = 40 30
```
